Pump, valve, and tubing assembly

- Connect tubing as shown below. All tubing is 0.75 inch inside diameter except for the bypass hose, which is 0.5 inch i.d.
- “GHT” means “garden hose thread”. These connectors allow you to hook up to common garden hose connectors for transferring water to and from the Emriver model.
- Hose clamps are provided for all connections. The connections should be tight without them, though, and we recommend clamping only the valve manifold connection (shown below), if you use the model indoors because a leak there drips onto the floor.
